Installation Apache et exposition NAT du port 80

Le serveur HTTP Apache est le serveur Web le plus utilisé au monde. Il fournit de nombreuses fonctionnalités puissantes, notamment des modules chargeables dynamiquement, une prise en charge multimédia robuste et une intégration étendue avec d'autres logiciels populaires.

```
apt install apache2
```

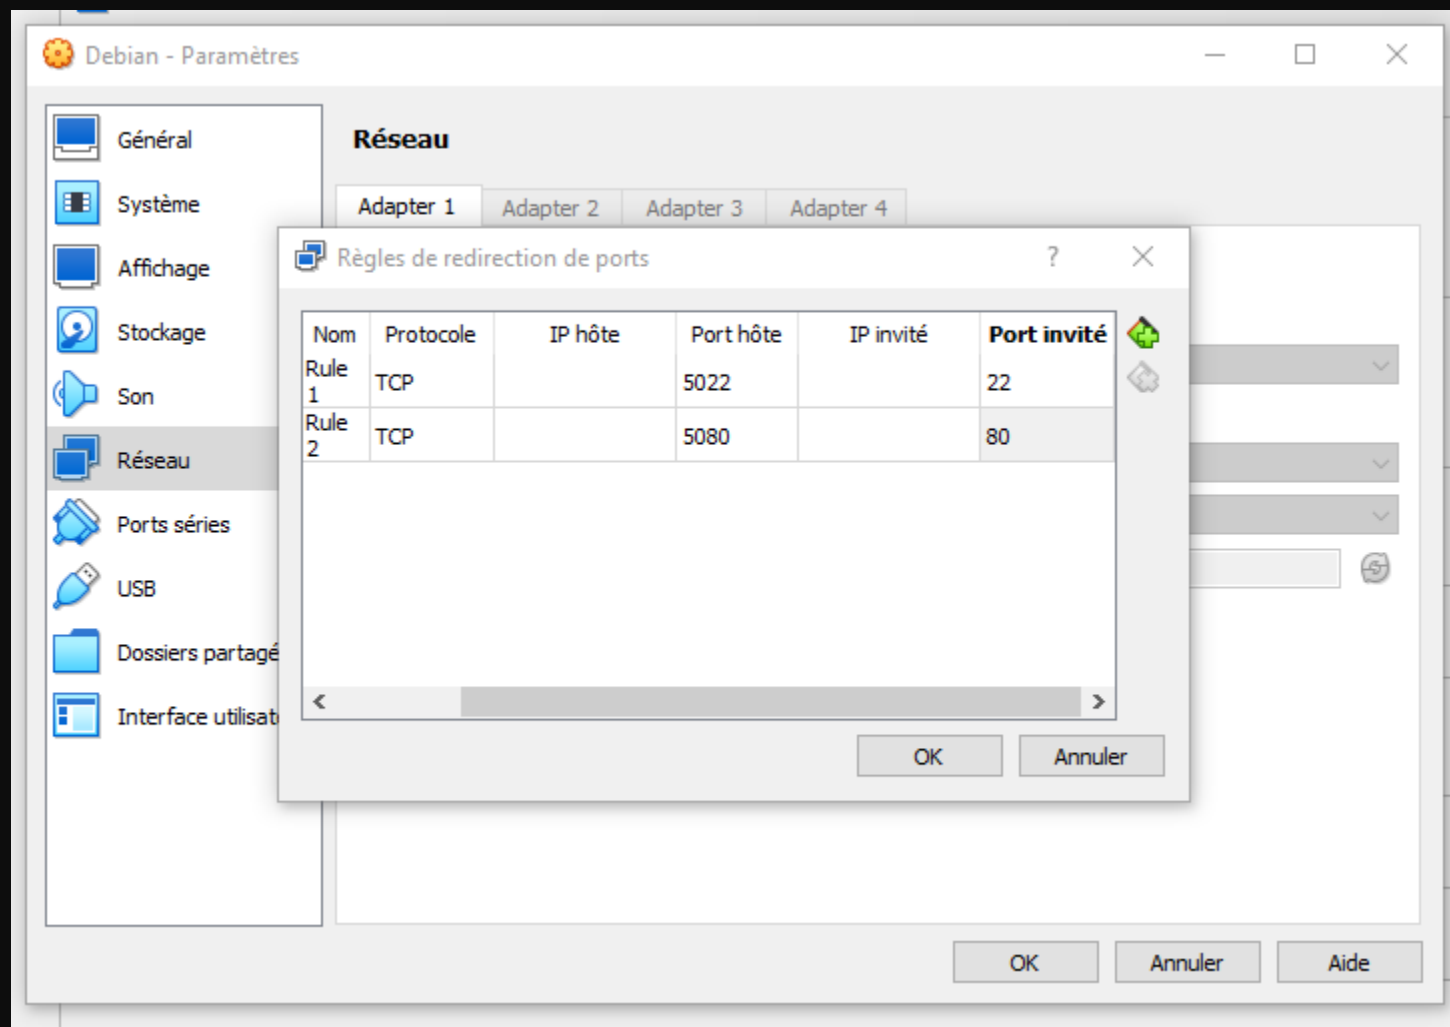

```
systemctl status apache2
```

```
root@Debian:/var/www# ps aux | grep apache
www-data  3760  0.0  0.0  3496  164 ?        Ss   05:01   0:00 /usr/bin/htcacheclean -d 120 -p /var/cache/apache2/mod_cache_disk -l 300M -n
root      13569  0.0  1.0 194452 20572 ?        Ss   05:48   0:00 /usr/sbin/apache2 -k start
www-data  13570  0.0  0.5 194912 10336 ?        S    05:48   0:00 /usr/sbin/apache2 -k start

root@Debian:/var/www#
```

ps aux | grep apache

le service démarre en tant que root afin de faire des choses comme se lier aux ports réservés (par exemple 80 et 443). Ensuite, il démarre quel que soit le nombre de processus configurés, pour effectuer le travail du serveur Web et toute autre tâche, en tant qu'utilisateurs définis.

De cette façon, les demandes sont traitées par des processus non privilégiés. Vous remarquerez que l'ID parent (PPID) est le même pour tous les autres processus. Cette idée sera le PID pour ce processus exécuté en tant que root.

debian

Apache2 Debian Default Page

It works!

This is the default welcome page used to test the correct operation of the Apache2 server after installation on Debian systems. If you can read this page, it means that the Apache HTTP server installed at this site is working properly. You should **replace this file** (located at `/var/www/html/index.html`) before continuing to operate your HTTP server.

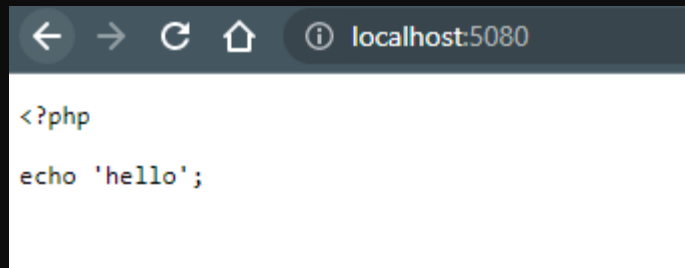

If you are a normal user of this web site and don't know what this page is about, this probably means that the site is currently unavailable due to maintenance. If the problem persists, please contact the site's administrator.

Configuration Overview

Debian's Apache2 default configuration is different from the upstream default configuration, and split into several files optimized for interaction with Debian tools. The configuration system is **fully documented in `/usr/share/doc/apache2/README.Debian.gz`**. Refer to this for the full documentation. Documentation for the web server itself can be found by accessing the **manual** if the `apache2-doc` package was installed on this server.

The configuration layout for an Apache2 web server installation on Debian systems is as follows:

```
/etc/apache2/  
|-- apache2.conf  
|   |-- ports.conf  
|-- mods-enabled  
|   |-- *.load  
|   |-- *.conf  
|-- conf-enabled  
|   |-- *.conf  
|-- sites-enabled  
|   |-- *.conf
```

A screenshot of a web browser window. The address bar shows 'localhost:5080'. The page content is a simple PHP script: `<?php` followed by `echo 'hello';` on the next line. The browser's user interface includes back, forward, refresh, and home buttons.

```
<?php
echo 'hello';
```

Apache n'est pas capable
de lire du PHP

Installer le serveur Apache,
vérifier le statut du daemon et
ses droits sur le système

Installation PHP

```
sh -c 'echo "deb https://packages.sury.org/php/ $(lsb_release -  
sc) main" > /etc/apt/sources.list.d/php.list'
```

→

```
wget -qO - https://packages.sury.org/php/apt.gpg | sudo apt-key  
add -
```

php.list

→ deb https://packages.sury.org/php/ \$(lsb_release -sc) main

```
apt install php8.1
```

```
apt install libapache2-mod-php8.1
```

```
apt install php7.4
```

```
apt install libapache2-mod-php7.4
```

majör

minör

patch

```
apt install php5.6
```

```
apt install libapache2-mod-php5.6
```

7.4.3

Maintenant Apache peut
lire le PHP ! 😊

Installez PHP version 7.4

Installation MySQL/MariaDB **sans** exposition NAT du port 3306

```
apt install mariadb-server
```

```
systemctl status mysqld
```

mysql_secure_installation

In order to log into MariaDB to secure it, we'll need the current password for the root user. If you've just installed MariaDB, and haven't set the root password yet, you should just press enter here.

Enter current password for root (enter for none):
OK, successfully used password, moving on...

Setting the root password or using the unix_socket ensures that nobody can log into the MariaDB root user without the proper authorisation.

You already have your root account protected, so you can safely answer 'n'.

Switch to unix_socket authentication [Y/n] n
... skipping.

You already have your root account protected, so you can safely answer 'n'.

Change the root password? [Y/n] n
... skipping.

By default, a MariaDB installation has an anonymous user, allowing anyone to log into MariaDB without having to have a user account created for them. This is intended only for testing, and to make the installation go a bit smoother. You should remove them before moving into a production environment.

Remove anonymous users? [Y/n]
... Success!

Normally, root should only be allowed to connect from 'localhost'. This ensures that someone cannot guess at the root password from the network.

Disallow root login remotely? [Y/n]
... Success!

By default, MariaDB comes with a database named 'test' that anyone can access. This is also intended only for testing, and should be removed before moving into a production environment.

Remove test database and access to it? [Y/n]
- Dropping test database...
... Success!
- Removing privileges on test database...
... Success!

Reloading the privilege tables will ensure that all changes made so far will take effect immediately.

Reload privilege tables now? [Y/n]
... Success!

Cleaning up...

All done! If you've completed all of the above steps, your MariaDB installation should now be secure.

Thanks for using MariaDB!
root@Debian:/var/www/html#

```
systemctl restart mysqld
```

En plus du package php, vous aurez besoin de php-mysql, un module PHP qui permet à PHP de communiquer avec une base de données basée sur MySQL, telle que MariaDB.

```
apt install php-mysql
```

```
root@Debian:/var/www/html# mysql -u root
Welcome to the MariaDB monitor.  Commands end with ; or \g.
Your MariaDB connection id is 30
Server version: 10.5.18-MariaDB-0+deb11u1 Debian 11

Copyright (c) 2000, 2018, Oracle, MariaDB Corporation Ab and others.

Type 'help;' or '\h' for help. Type '\c' to clear the current input statement.

MariaDB [(none)]> create database dbtest;
Query OK, 1 row affected (0.000 sec)

MariaDB [(none)]> use dbtest;
Database changed
MariaDB [dbtest]>
```

```
<?php
try
{
    $db = new PDO('mysql:host=localhost;dbname=dbtest;charset=utf8',
    'root', 'toor');
}
catch (Exception $e)
{
    die('Erreur : ' . $e->getMessage());
}
```

Apache peut se
connecter !

Installez un serveur MySQL

Configuration des extensions Apache

```

review

```
a2enmod rewrite
```

```
root@Debian:/etc/apache2/mods-available# a2enmod rewrite
Enabling module rewrite.
To activate the new configuration, you need to run:
  systemctl restart apache2
root@Debian:/etc/apache2/mods-available# systemctl restart apache2
root@Debian:/etc/apache2/mods-available#
```

En plus du package php, vous aurez besoin de php-mysql, un module PHP qui permet à PHP de communiquer avec une base de données basée sur MySQL, telle que MariaDB.

Activez l'extension Apache rewrite

Configuration des extensions PHP

```
<?php
try
{
    $db = new PDO('mysql:host=localhost;dbname=dbtest;charset=utf8',
    'root', 'root');
}
catch (Exception $e)
{
    die('Erreur : ' . $e->getMessage());
}

phpinfo();
```
